

Building efficiently, economically and safely.

With the HSE Management on Construction Sites programme from TÜV Rheinland.

HSE = Health. Safety. Environmental Protection.

The best possible combination for your construction project.

The construction industry is booming. New power plants, airports, sports facilities, high-voltage power lines, chemistry plants, steelworks, refineries and production plants are being built around the world. At the same time, a shortage in staffing resources and increased costs of materials are putting huge pricing pressure on plant construction firms and building contractors. In the worst-case-scenario, this ends in quality problems, overshooting the budget or pressure meeting deadlines, and it can lead to safety standards and environmental protection conditions being neglected. However, in these very areas in which occupational safety is the highest priority, the safety of individuals and the environment must be assured. The TÜV Rheinland HSE Manager unifies all the necessary expertise for a safe and cost-optimised construction process.

Safety is a good feeling.

With the integrated HSE Management programme from TÜV Rheinland you can reliably achieve what is most important to you as a company manager. You can meet legal requirements and combine financial success with safety standards, legal compliance, corporate responsibility and environmental protection. This is because our HSE team will support you with a mutual goal: Zero incidents.

Our approach.

Neglectfulness, which in many processes can slip through unnoticed, can have fatal consequences. However, keeping an overview of everything in a construction project is a major challenge, even for the most attentive employee. We will therefore provide you with a qualified HSE Manager for your construction project, who will be able to identify potential weaknesses in good time.

In consultation with you, and based on your internal specifications, standards and regulations, we will carry out an objective comparison on the fulfilment of HSE processes in relation to the company targets set by you (target/actual comparison). Based on the findings from this comparison, we will then draw up the necessary documents for your project, e.g. HSE plans or instructions. The process flows developed together with our experts will support you in implementing an effective HSE management system. Furthermore, the available documentation will allow you to evaluate the effectiveness of the HSE system and check compliance with the legal and internal directives for construction sites.

Our HSE Manager will be by your side in all of this as your partner, and will keep an eye on your targets and provide you with holistic advice. This means you and your employees will benefit from a sustainable and integrated safety concept, not only during the planning and construction phase, but also after the end of the project. We will document the results of our actions in black and white.

Our Team.

We use only trained personnel with long-standing experience in national and international projects. This ensures we provide the best possible safety for individuals and companies. In addition to specialist expertise and physical aptitude, our HSE team is distinguished by its highest possible level of social skills. Our staff always find the right tone, even in conflicts and profession-related instructions with regard to foreign workers. The highest standards of technology embedded in an international organisation ensure that you can always rely on us - and rely on us worldwide.

The benefits for you.

- You will benefit from clear structures and processes
- Optimised processes ensure effectiveness, quality and time-saving
- Gap-free documentation is guaranteed
- Your construction timetable is followed
- The construction site management is relieved from the stresses surrounding health, safety and environmental protection matters
- Possible safety gaps and hazardous situations are detected and eliminated through appropriate protective measures
- Zero-accident strategy for individuals, the environment and material goods
- Emergency planning for staff
- Legal compliance with the relevant national and international laws and standards
- Improved image from a commitment to health, safety and environmental issues
